

**Problem 2.** The solubility product of  $\text{CuCl}_2$  is  $3.2 \times 10^{-7}$  at  $25^\circ\text{C}$ . Calculate the solubility of  $\text{CuCl}_2$  in mole litre $^{-1}$ .

- $\text{CuCl}_2$  is a sparingly soluble salt.
- Let  $x$  is the solubility of  $\text{CuCl}_2$  in mole litre $^{-1}$
- The following equilibrium exists in its saturated solution:

*Equilibrium concentration,*       $x$        $x$        $2x$

- Therefore, solubility product,  $K_{sp} = [\text{Cu}^{+2}] [\text{Cl}^-]^2$

or,       $3.2 \times 10^{-7} = [x] [2x]^2$

or,       $4x^3 = 3.2 \times 10^{-7}$

$\therefore$        $x = 4.3 \times 10^{-3} \text{ mole litre}^{-1}$

Ans

**Problem 3.**  $K_{sp}$  of  $\text{CaF}_2$  is  $1.7 \times 10^{-10}$  and its mol. wt. is  $78 \text{ g mole}^{-1}$ . What volume of the saturated solution will contain  $0.078 \text{ g}$  of  $\text{CaF}_2$ ?

- $\text{CaF}_2$  is a sparingly soluble salt.
- Let  $x$  is the solubility of  $\text{CaF}_2$  in mole litre $^{-1}$
- The following equilibrium exists in its saturated solution:

*Equilibrium concentration,*       $x$        $x$        $2x$

- Therefore, solubility product,  $K_{sp} = [\text{Ca}^{+2}] [\text{F}^-]^2$

$$\text{or, } 1.7 \times 10^{-10} = [x] [2x]^2$$

$$\text{or, } 4x^3 = 1.7 \times 10^{-10}$$

$$\therefore x = 3.5 \times 10^{-4} \text{ mole litre}^{-1}$$

- $\therefore$  1 litre saturated solution contains  $3.5 \times 10^{-4}$  mole of  $\text{CaF}_2$

### .....Problem-3 (contd.)

- No. moles of  $\text{CaF}_2 = 0.078\text{g} / (78\text{g/mole})$   
 $= 1.0 \times 10^{-3} \text{ moles}$
- $\therefore \text{Volume of the solution} = \frac{1 \text{ litre} \times 1.0 \times 10^{-3} \text{ mole}}{3.5 \times 10^{-4} \text{ mole}}$   
 $= 2.857 \text{ litre}$
- Thus, 0.078 g of  $\text{CaF}_2$  is contained in 2.9 litres of the saturated solution. Ans

**Problem 4.** Calculate the solubility of AgCl ( $K_{sp} = 1.7 \times 10^{-10}$ ) in 0.01 M NaCl solution.

- |                       |   |   |
|-----------------------|---|---|
|                       | $\text{AgCl} \leftrightarrow \text{Ag}^+ + \text{Cl}^-$ | $\text{NaCl} \leftrightarrow \text{Na}^+ + \text{Cl}^-$ |
| <i>equilib. conc.</i> | x      x      x   | 0.01    0.01    0.01M                                   |
- Complete ionization of the salt in aqueous solution is assumed.  
Therefore, total concentration of  $\text{Cl}^-$  in the solution =  
0.01 M (from NaCl) + x M (from AgCl)
- As AgCl is sparingly soluble, x is negligibly small.  
 $\therefore [\text{Cl}^-] \cong 0.01 \text{ M}$   
 $\therefore K_{sp} = [\text{Ag}^+][\text{Cl}^-]$   
or,  $1.7 \times 10^{-10} = (x)(0.01) \text{ M}$   
or,  $x = 1.7 \times 10^{-8} \text{ M}$
- $\therefore$  The solubility of AgCl in 0.01M NaCl solution is  $1.7 \times 10^{-8} \text{ M}$  Ans

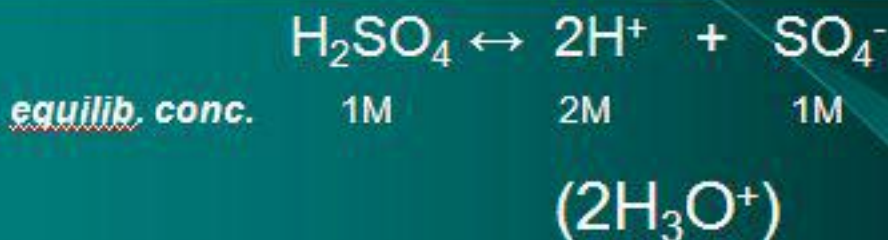

**Problem 5.**  $K_{sp}$  of  $Mg(OH)_2$  is  $1.8 \times 10^{-11}$  at  $25^\circ C$ .  
 Calculate the solubility of  $Mg(OH)_2$  in 0.1 M aqueous  $NaOH$  solution.

- $$\begin{array}{ccccccc}
 Mg(OH)_2 & \leftrightarrow & Mg^{+2} & + & 2OH^- & NaOH & \leftrightarrow & Na^+ & + & OH^- \\
 \text{equilib. conc.} & & x & & x & 2x & & 0.1 & & 0.1 & 0.1M
 \end{array}$$
- Complete ionization of the salt in aqueous solution is assumed. Therefore, total concentration of  $OH^-$  in the solution =
- 0.1 M (from  $NaOH$ ) +  $2x$  M (from  $Mg(OH)_2$ )
- As  $Mg(OH)_2$  is sparingly soluble,  $x$  is negligibly small.
- $\therefore [OH^-] = (0.1 + 2x)M \cong 0.1 M$
- $\therefore K_{sp} = [Mg^{+2}][OH^-]^2$
- or,  $1.8 \times 10^{-11} = (x)(0.1)^2 M$
- or,  $x = 1.8 \times 10^{-9} M$
- $\therefore$  The solubility of  $Mg(OH)_2$  in 0.1M  $NaOH$  solution is  $1.8 \times 10^{-9} M$

Ans.

**Problem 6. Calculate pH and pOH of 0.02 M  $\text{H}_2\text{SO}_4$  solution.  $K_w = 1 \times 10^{-14}$  at  $25^\circ\text{C}$ .**

If  $\text{H}_2\text{SO}_4$  in 1M solution ionizes completely,  $[\text{H}_3\text{O}^+]$  will be 2M.

Therefore, in a 0.02 M  $\text{H}_2\text{SO}_4$  solution

$$[\text{H}_3\text{O}^+] = 0.04 \text{ M}$$

$$\therefore [\text{OH}^-] = K_w / [\text{H}_3\text{O}^+] = (1 \times 10^{-14}) / 0.04 = 2.5 \times 10^{-13} \text{ M}$$

$$\therefore \text{pH} = -\log [\text{H}_3\text{O}^+] = -\log (0.04) = 1.40$$

$$\therefore \text{pOH} = -\log [\text{OH}^-] = -\log (2.5 \times 10^{-13}) = 12.60 \quad \text{Ans.}$$

Problem -7. pH of an aqueous solution of HCl is 2.699 at 25°C. Calculate the molarity of the solution.

- We know from the definition of pH,

$$\text{pH} = -\log_{10} [H^+] = \log_{10} \frac{1}{[H^+]}$$

- $\therefore 2.699 = -\log [H_3O^+]$
- or,  $[H_3O^+] = \text{antilog} (-2.699) = 0.002 \text{ M}$
- As HCl is a strong acid, it will ionize completely in the aqueous solution. So the molarity of HCl in the solution will be equal to the concentration of  $H_3O^+$ .
- $\therefore$  Molarity of HCl in the solution is 0.002.     Ans.

**Problem 1. Calculation of normality of strong acids, (a) 36% (w/w) HCl, specific gravity 1.18; (b) 96% (w/w) H<sub>2</sub>SO<sub>4</sub>, specific gravity 1.84.**

**Solution 1(a):**

- Given, 36% (w/w) HCl, specific gravity 1.18
- Mol. Wt. of HCl = 36.5, gram-equiv-wt = 36.5
- $\therefore$  1 ml conc. HCl contains =  $0.36 \times 1.18$  gm of HCl
- $\therefore$  1000 ml conc. HCl contains =  $0.36 \times 1.18 \times 1000$
- = 424.8 gm of HCl
- $\therefore$  36.5 gm of HCl in 1000ml solution = 1.0 N HCl
- $\therefore$  424.8 gm HCl in 1000ml =  $(1 \times 424.8 \text{ gm}) / 36.5 \text{ gm}$
- » = 11.64 N HCl      Ans.

## .....Problem-1 (contd.)

### Solution 1(b):

Given, 96% (w/w)  $\text{H}_2\text{SO}_4$ , specific gravity 1.84

Mol. Wt. of  $\text{H}_2\text{SO}_4 = 98$ , gram-equiv-wt = 49

$\therefore$  1 ml conc.  $\text{H}_2\text{SO}_4$ , contains =  $0.96 \times 1.84$  gm of  $\text{H}_2\text{SO}_4$ ,

$\therefore$  1000 ml conc.  $\text{H}_2\text{SO}_4$ , contains =  $0.96 \times 1.84 \times 1000$   
= 1766.4 gm of  $\text{H}_2\text{SO}_4$ ,

$\therefore$  49 gm of  $\text{H}_2\text{SO}_4$ , in 1000ml solution = 1.0 N  $\text{H}_2\text{SO}_4$ ,

$\therefore$  1766.4 gm  $\text{H}_2\text{SO}_4$ , in 1000ml =  $(1 \times 1766.4 \text{ gm}) / 49 \text{ gm}$   
= 36.05 N  $\text{H}_2\text{SO}_4$ ,      Ans.
